Geological impacts in the formation of the archaeological site in Kastanofyto cave, Greece

Georgia Karadimou¹, Konstantinos Trimmis², George Lazaridis

Summary: Kastanofyto cave is located at Kastoria's prefecture in Greece. Its total length is over 600 m and an active underground river passes through it. During the exploration of the cave, sherds of pottery were noticed at all his length. During the research, an archaeological site in the first chamber of the cave was identified. The geological factors which adversely affected at the depositional and post- depositional procedures were also studied.
